## SECTION 1. INTRODUCTION

The MicroPACS is a Windows or Linux based PACS system that has, at it's core, the UCDCM DICOM Network Transport libraries. This system has been combined with a complete user interface (Windows only), which also acts as installation program (written in Borland Delphi) to form the Conquest DICOM server. The Information Definition is designed to be field/run-time programmable. Below the DICOM interface is a database connectivity class that uses a stable built-in SQLite or DBASEIII driver, or talks to ODBC compatible data sources (Windows only), MySQL, or PostGres. This combination permits a PACS system with the following features:

- Complete DICOM Interface. Including SCP's for run-time programmable storage IOD's, and SCP for DICOM Queries and Retrieves.
- Programmable SQL Database tables. This user-programmable feature allows the MicroPACS to be custom tailored to a particular Clinical/Research area. For instance, in a CR setting, the PACS system can be programmed to allow users to query on kvp and ma or in a CT setting, the PACS can be programmed to allow queries on slice-distance.
- Communication to database is done via a SQLite (default and advised for small archives of up to 1000.000 images), a built-in dBaseIII driver, any ODBC database (Windows only), MySQL or PostGres. This allows decoupling PACS and SQL technology. ODBC was tested with:
  - Microsoft Access
  - SQL server
  - Some users have reported successful operation using Interbase and Oracle. Oracle requires manual editing of the DICOM.SQL file, where the names of fields 'rows' and 'columns' are changed to, e.g., 'qrows' and 'qcolumns'.

**Note:** The built-in dBaseIII driver (Conquest addition) is not a full SQL server and poses limitations on query keys: only queries like 'key' = exact match; 'key\*' = value starts with key; and '\*key\*' = value contains key, are supported, as well as date-range queries and multiple UID matching queries. Only common hierarchical queries are supported with fields that are listed in the single de-normalized table for the selected query level (see file DICOM.SQL). Regular queries passing PatientID, StudyUID, and/or SeriesUID will be (very) fast, even for huge archives. Other (image) queries in large archives (>1000.000 images) may be very slow. Server startup time for huge archives may be long due to in-memory index creation (about 1 minute per 1000.000 images). During indexing the server is read-only and only shows indexed images.

- (Conquest addition) Fast and safe (CRC checked) error free compression (>2x) of image data on disk. Do not use this option if you want to read the image files directly from disk yourselves using third party software.
- (Conquest addition) Easy installation of many servers on a single PC. Servers may run as service(s).
- (Conquest addition) A database browser and slice viewer (Windows only) integrated in the PACS system with options for: viewing the DICOM information in a slice, creating BMP files (ideal for slides), sending

selected images, printing, and database fix tools such as changing patient IDs, and deleting and anonymizing studies and series. Also tools to merge or split series. Drag and drop to load DICOM or HL7 files, directories, or a variety of zip files (you then need to place 7za.exe in the server directory).

- (Conquest addition) A simple query/move user interface (Windows only) for diagnostic purposes, to improve your knowledge of DICOM, and to grab missing data from another server.
- (Conquest addition) Fully integrated functionality in one user interface.
- (Conquest addition) Simple print server (Windows) - to default printer.
- (Conquest addition) Log files, which are daily zipped (Windows only). We use the TZipMaster VCL by Chris Vleghert and Eric W. Engler.
- (Conquest addition) Correct display of JPEG(2000) and RLE compressed images in browser.
- (Conquest addition) Flexible configuration of JPEG and NKI private compression with optional (de)compression of incoming, dropped, transmitted and archived files. Since version 1.4.16, JPEG and JPEG2000 engines are built-in using the International JPEG group and Jasper code (Interfacing by Bruce Barton). JPEG (de)compression used to be done (and this can still be configured) using executables from the OFFIS DICOM toolkit (DCMTK version 3.5.3), developed by Kuratorium OFFIS e.V..
- (More conquest additions) Highly improved performance (e.g., using a read-ahead thread), and image forwarding/action capability.
- The archive is well suited as DICOM server for the DICOMWORKS viewer by Phillipe Puech.
- If the BDE is not installed, we use the MiTeC DBFTable component by MichaL MutL. For other data sources ADO is used (Windows only). Native drivers use the DLL's from the database system (MySQL or Postgres).
- Version 1.4.12 up can use a native MySQL driver (based on Rangel Gustavo Reale's TMySQLDataset and Matthias Fichtner's mysql.pas) and includes a preliminary advanced series viewer based on EZDicom / K-Pacs (many thanks to Chris Rorden and Andreas Knopke). Fixes: strip group 2 information of any files sent, retry logic, worklist query.
- Version 1.4.12 improves database performance, has some important bug fixes (rare crashes, incomplete deletion and grabbing, and rare database corruption on dbaseIII). Further it has the possibility to forward multiple images on a single association, and improved documentation
- Version 1.4.12b and c add importconverters and bug fixes in dbaseIII driver and web access and do not allow .dcm with nki compression
- Version 1.4.13 has a web viewer based on K-PACS, SQLite is now included, and more import and export converter options were added such as delayed forwarding and preretrieval. Then small fixes were made in native mysql (also the driver is now included in the package), and several other aspects of the server, such as handling of compression errors, out of memory conditions, and others.
- Version 1.4.14 has a more web options (move, delete and viewers), more exportconverters and 'Number of Patient Related Studies' etc. query items

- Version 1.4.15alpha fixes small bugs; and adds QueryConverters, color jpeg decoding with built-in code, frame control, several command line options, an anonymization script, postgres support, and jpeg web export graphics
- Version 1.4.15 fixes more small bugs and adds more scripting options
- Version 1.4.16beta adds internal JPEG and JPEG2000 codecs adapted by Bruce, more scripting options, bug fixes and print to AE from GUI
- Version 1.4.16rc1 adds WADO, virtual query cache, zipping and cleanup at night also for a service, animated gif support, more commands and fixes
- Version 1.4.16rc2 fixes some bugs
- Version 1.4.16rc4 adds lua as very fast and flexible scripting language for converters (with access to configuration, connection, dicom objects, pixel data, database, queries) and web page design
- Full release 1.4.16 fixes several bugs
- Full release 1.4.17alpha fixes bugs and really enhances scripting
- Version 1.4.17 offers connections to the ZeroBraneStudio Lua IDE and further enhances scripting; some fixes for jpeg transfer syntax
- Version 1.4.17b, c and d offer bug fixes and more scripting options

## A.1 IMPLEMENTATION MODEL

### A.1.1 Application Data Flow Diagram

### A.1.2 Functional Definition of AE's

Application Entity 1, MicroPACSMMain

Supports the following functions:

- Has access to patient demographics and pixel data in the local database.
- Responds to DICOM associations containing image and worklist query requests using the information in the local database.
- Moves IOD modules to any configured DICOM AE when requested to do so by a remote DICOM AE.
- Responds to DICOM associations containing storage requests and places the IOD in the local database.
- Responds to DICOM associations containing verification requests.
- Responds to DICOM associations containing print requests and prints items on the default local Windows printer.
- Responds to private DICOM associations to support the WEB interface and maintenance functions.
- Responds to private DICOM associations to initiate scripting

**NOTE:** The Conquest Applications (not part of the server release) or other DICOM network viewers (e.g., KPacs) will use separate AE's which **MUST** be configured in ACRNEMA.MAP (use the "**Known DICOM providers**" page) to allow access of images from the DICOM server.

### A.1.3 Sequencing of Real - World Activities

Image Store:

- The remote AE will initiate a DICOM association.
- Any association will trigger Lua scripts *association* and *endassociation*.
- The MicroPACSMMain AE will select the appropriate Abstract and Transfer Syntax's from those proposed by the remote AE.
- The remote AE will initiate a C-Store to send the IOD.
- Any command will trigger Lua script *command*.
- The MicroPACSMMain AE will respond with a C-Store-RSP upon receipt of the IOD.
- If AllowEmptyPatientID is set to 0 (default), a missing PatientID is replaced by "00000000". If AllowEmptyPatientID=1 and the patient ID is not set, it is looked up from the database for the corresponding study. Conversely if AllowEmptyPatientID=1 and there is no patient ID in the database but there is in the image, the database is updated.
- The following processing occurs using the WorkList database (can be enabled/disabled using 'WorkListMode' in DICOM.INI):
  - WorkListMode=0: no processing occurs.
  - WorkListMode=1: The AccessionNumber is looked up in the local WorkList database, if it is found, any element in the DICOM object that is also present (and non-NULL) in the WorkList database, will be replaced by the value from the WorkList database. These changes are made both in the database and in the image that is stored on disk.
  - WorkListMode=2: As mode 1, but the image will be refused if the AccessionNumber is not found. Rejected images trigger event RejectedImageWorkListConverter.

- Note: there is no DICOM method of filling the worklist database (see the description of WorkListMode).
- The following processing (can be enabled/disabled by defining 'FixPhilips = 0/1' in DICOM.INI) of the patient ID occurs to conform patient ID's generated by a Philips scanner with NKI policy:
  - From a patient ID of 10 digits (i.e., only exactly 10 digits) and a numeric value larger than 0001000000, starting with at least 2 zeros, the first 2 or 3 leading zeros are stripped. I.e., '0123456789' is not changed, '0020101234' is replaced by '20101234', '0009901234' is replaced by '9901234', and '0000012345' is replaced by 0012345. The result is that a 10 digit ID from Philips that consists of a valid NKI patient ID with extra leading zeros is converted to a valid NKI patient ID. These changes are made both in the database and in the image that is stored on disk.
- The following processing (can be enabled/disabled by defining 'FixKodak = 0/1' in DICOM.INI) of the patient ID occurs to conform patient ID's generated by a Kodak RIS worklist with NKI policy:
  - From a patient ID of 8 digits (i.e., only exactly 8 digits) and a numeric value larger than 01000000, starting with at least 1 zero, the leading zero is stripped. I.e., '0123456789' is not changed, '09901234' is replaced by '9901234', and '00012345' is replaced by 0012345. The result is that a 8 digit ID from Kodak RIS that consists of a valid NKI patient ID of before 2000 with a superfluous leading zero, is converted to a valid NKI patient ID. These changes are made both in the database and in the image that is stored on disk.
- Trailing space are discarded from the patient ID.
- Up to 99 importConverters are called as scripts or rules to modify, delete or log images or VR's in them. These scripts can also start external programs and delete/retrieve/forward parts of the patient's information. All scripts can optionally be programmed in Lua with full access to server configuration and DICOM objects.
- The pixel data is (re or un)compressed if this option is enabled.
- The image is stored and disk and image header data is (re-)entered in the database at all four levels (patient, study, series, and image). The following consistency checking is performed on the data entered in the database (without changing the image information that is stored):
  - Inconsistent link information (e.g., two images of the same series belong to different patients), lead to a reject to store the new image with reported failure to the sending client. The rejected images are passed through (lua) script 'RejectedImageConverter0' to allow extensive logging or repair actions.
  - Filled items will not be overwritten by empty items.
  - Known sex (M or F) in the patient database will not be overwritten with any other value than M or F.
  - A known date of birth in the database will not be overwritten with an empty date or with a date on the 1st of January (which has a high probability to be wrong). When the original date of birth is empty, any value will be accepted.
  - In case of any other inconsistency, the newer values will be written in the database, and the change will be logged as a warning in serverstatus.log. Inconsistencies in the birthdate are also logged in PacsTrouble.log.

- The (series) Modality field is appended to the Study Modality field in the database if it does not already contain this Modality.
- The PatientName, PatientBirthDate and PatientSex items are duplicated in the study table (database rev8 and up), to allow detection of patient ID mix-ups.
- Optionally the image is processed or forwarded (compressed or uncompressed) if Modality and StationName match with values specified in dicom.ini and the optional ExportFilter test is passed using scripts ExportConverter0 .. ExportConverter19 (see appendix 7).
- Some logging of activity occurs.

#### Query/Retrieve:

- The remote AE will initiate a DICOM association.
- The MicroPACSMMain AE will select the appropriate Abstract and Transfer Syntax's from those proposed by the remote AE.
- Queries and retrieves can be inspected, modified or rejected by (Lua) scripts 'QueryConverter0' and 'RetrieveConverter0'. The script can also trigger move or deletes of associated data.
- Queries can be forwarded to up to 10 VirtualServerFor entries. Queries that are forwarded are processed by VirtualServerQueryConverter0. The received data is processed by VirtualServerQueryresultConverter0 and will be merged with the data from the server's database and cleaned of duplicates (see appendix 7). Query results may be cached to speed up repetitive queries.
- Optionally the 'Number of Patient Related Studies'-like items will be computed (this executes another query for each result of the first query) and is somewhat slow.
- The returned query results can be processed by a (Lua) script called 'QueryResultConverter0'.
- Upon receipt of a C-Move request, the MicroPACSMMain AE will initiate an SSC/SCU association morphing to the stored IOD SOP Class to the specified and configured DICOM AE. Compressed pixel data will be decompressed or recompressed prior to transmission. Optionally a (Lua) script 'RetrieveResultConverter0' will process the retrieved image data. A C-Move response message will be generated synchronously with the associated C-Store.
- Retrieval of data stored on one or more of the VirtualServerFor entries and not on the local server will initiate automatic transfer from the listed servers in the VirtualServerFor table to the local server, followed by (or overlapping) a transfer to the C-MOVE destination. After the retrieval data can be optionally deleted again (see appendix 7).
- Some logging of activity occurs.

#### Worklist Query:

- The remote AE will initiate a DICOM association.
- The MicroPACSMMain AE will select the appropriate Abstract and Transfer Syntax's from those proposed by the remote AE.
- Queries can be inspected, modified or rejected by a (Lua) script called 'WorkListQueryConverter0'.
- The MicroPACSMMain AE will query the Worklist database and respond with zero or more modality worklist items. The sequence structure of the responses duplicates that of the query.

- The query results can be processed with a (Lua) script called 'ModalityWorkListQueryResultConverter0'.
- Some logging of activity occurs.
- Note: there is no DICOM method of filling the worklist database. It can be filled through the web interface, by drag and dropping HL7 files or programmatic (see the description of WorkListMode).

#### Verification:

- The remote AE will initiate a DICOM association.
- The remote AE will initiate a C-ECHO.
- The MicroPACSMMain AE will respond with a C-ECHO-RSP.
- Many private command options can be added to the C-ECHO command.
- Some logging of activity occurs.

#### DICOM Print:

- The remote AE will initiate a DICOM association.
- The remote AE will create a basic film session using N-CREATE.
- The MicroPACSMMain AE will ignore the information but will respond with a N-CREATE-RSP.
- The remote AE will create a basic film box using N-CREATE.
- The MicroPACSMMain AE extracts the Image Display Format (only "STANDARD\#rows,#cols" is accepted), and the film orientation (LANDSCAPE or PORTRAIT) and passes this information to the CONQUEST user interface. All other information is ignored.
- The MicroPACSMMain AE creates the correct amount of Basic Grayscale or Color Image Box objects for the film page and transmits their UIDs to the remote AE in the N-CREATE-RSP. The UIDs contain information about the page number, number of rows and columns, and the image location on the page that will be used by the CONQUEST user assemble the printed page.
- The remote AE will use N-SET to fill each Image Box object.
- The MicroPACSMMain AE will store each incoming Image Box onto disk (in directory "printer\_files" on device MAG0) and responds with N-SET-RSP. The name (UID) of the files is passed to the CONQUEST user interface.
- The CONQUEST user interface (Windows only) will queue incoming images and will asynchronously convert each DICOM file into a BMP file, load it in memory and assemble the pictures to be printed on a page. Processed DICOM files and BMP files are deleted. *Note: the basic print support in the CONQUEST user interface will not handle multiple simultaneous print requests correctly!*
- The remote AE will request printing of each film or of the complete session using an N-ACTION command for a basic film session or a basic film box.
- The MicroPACSMMain AE passes these requests onto the CONQUEST user interface and responds with an N-ACTION-RSP.
- The CONQUEST user interface (Windows only) prints the pages on the default Windows printer. The only way to configure this printer is to change its default document settings in Windows. Printing progress is shown using a simple progress bar on the server status page.
- The remote AE may query the printer status with a N-GET request on the printer object.

- The MicroPACSMaIn AE will always respond with a N-GET-RSP with a “NORMAL” status and the name of the printer, which is pre-set to “Conquest dicom printer”.
- Other N-DELETE, N-SET, and N-EVENTREPORT requests are acknowledged with an adequate RSP and ignored.
- Some logging of activity occurs.

#### Web and WADO access:

- The remote client will request a web page from cgi-application dgate.exe
- The cgi-application will fill a page with information. Patient information is requested over a private DICOM protocol (e.g., query2 or patientlister) from the main server to fill tables. Furthermore links may be added to:
  - GIF, BMP or JPG images
  - Viewer controls
- Links to GIF/BMP/JPG images will access the cgi-application, which in turn will request them from the main server over a private DICOM protocol. The main server is responsible for converting DICOM to GIF/BMP/JPG.
- The CGI application can generate arbitrary web pages based on a simple scripting language and/or Lua scripts.
- Since 1.4.16, the server honors WADO requests which can be converted into normal DICOM retrieves to another server defined in the file `cgi-bin/dicom.ini` using item `[wadoservers]bridge`.
- The links to the viewer controls (OCX or Java) have two purposes. First the control will be downloaded and installed in the web viewer. This requires reduced security settings (trusted site), download of Java and/or installation of the OCX control with `regsrv32.exe`. Then the viewer controls will request DICOM images as needed from the cgi-application, which in turn will request these from the main server over a private DICOM protocol. The main server is responsible for (de)compressing and optionally downsizing the DICOM images.
- Web viewers based on the original k-pacs OCX control, ImageJA, Weasis, dwy, iaViewer and simple GIF/JPEG images are included with this release and can be configured in file `cgi-bin/dicom.ini`. The (Lua) scripts provided to drive most of these viewers can be user modified.

```

client      -> webserver      url      http://127.0.0.1/scripts/dgate.exe?mode=seriesviewer&series=...
webserver   -> dicomserver     query    imagelister:CONQUESTSRV1|.....
client      <- webserver <- dicomserver query results      (to build list of urls of dicom slices)

client      <- webserver      activex control http://127.0.0.1/ActiveFormProj1.ocx

Then for each slice that is required (the following line can also use WADO syntax):

control     -> webserver      url      http://127.0.0.1/scripts/dgate.exe?mode=dicom&slice=.....
webserver   -> dicomserver     request  convert_to_dicom:....
control     <- webserver <- dicomserver dicom data

```

## A.2 AE SPECIFICATIONS

#### A.2.1.1 Association Establishment Policies

##### A.2.1.1.1 General

The DICOM Application Context Name (ACN) that is always proposed is:

<b>Application Context Name</b>	<b>1.2.840.10008.3.1.1</b>
---------------------------------	----------------------------

The Maximum Length PDU negotiation is included in all association establishment requests. The maximum length PDU for an association initiated by the NetMain AE is:

<b>Maximum Length PDU</b>	<b>16Kbytes</b>
---------------------------	-----------------

The SOP class Extended Negotiation is not supported and ignored.

There is no limit on the maximum number of Presentation Contexts Items that will be proposed. In this implementation, each Abstract syntax will be proposed with either a single Transfer Syntax, or with a few JPEG(2000) transfer syntaxes, depending on the configuration in *acrnama.map*.

The user info items sent by this product are:

- Maximum PDU Length
- Implementation UID
- Implementation Version

**Note:** Max PDU length is not configurable at run time.

#### **A.2.1.1.2 Number of Associations**

MicroPACSMaIn AE will initiate one DICOM association to perform image store for each concurrently incoming C-MOVE request.

There is no artificial maximum placed on the number of simultaneous DICOM associations open at one time. It should be noted that system response time will be degraded, and this could possibly adversely effect a time-out period on other remote AE's.

The Print Management function will correctly handle multiple simultaneous associations, but the elementary print support in the CONQUEST user interface will not correctly print (i.e., images on the pages will be mixed up) when multiple print jobs are sent simultaneously.

#### **A.2.1.1.3 Asynchronous Nature**

Asynchronous mode is not supported. All operations will be performed synchronously.

#### **A.2.1.1.4 Implementation Identifying Information**

The Implementation UID allows unique identification of a set of products that share the same implementation.

The Implementation UID for this ID/Net v3.0 Implementation is:

<b>Storage &amp; Q/R UID</b>	<b>1.2.826.0.1.3680043.2.135.1066.101</b>
------------------------------	---

#### **A.2.1.2 Association Initiation by Real-World Activity**

##### **A.2.1.2.1 Proposed Presentation Contexts**

*Unknown	jl	JPEG2000 Lossy	1.2.840.10008.1.2.4.91	SCU	None

**Note:** Due to the morphing nature of the outgoing SSC-SCU engine, the specific Abstract Syntax that is proposed depends upon the nature of the stored image. The actual proposed Transfer Syntaxes depend on the configuration in *acrnama.map* and are the same for each class of stored images.

#### **A.2.1.2.1.2 SOP Specific Conformance Statement for Image Storage SOP Class**

This implementation can perform multiple C-STORE operations over a single association.

Upon receiving a C-STORE confirmation containing a successful status, this implementation will perform the next C-STORE operation. The association will be maintained.

Upon receiving a C-STORE confirmation containing an Error, Refused or Warning status, this implementation will fail the specific IOD in question. If more images need to be sent, they will be sent in the same association.

#### **A.2.1.2.2 Association Acceptance Policy**

##### **A.2.1.2.2.1 Real-World Activity**

This AE accepts associations for the Query/Retrieve (Q/R) SOP using the Patient Root, Study Root, and Patient/Study Only Query Model.

This AE accepts associations for the Image Storage Class using any defined IOD class.

This AE accepts associations for the Verification Service Class.

This AE accepts associations for the Print Service Class.

This AE accepts associations for the WorkList Query Service Class.

##### **A.2.1.2.2.2 Real-World Activity**

This AE is indefinitely listening for Q/R, Storage Class, Verification and Print Management associations

##### **A.2.1.2.2.3 Proposed Presentation Contexts**

Verification	1.2.840.10008.1.1	Little Endian	1.2.840.10008.1.2	SCP	None

**Note:** Due to the morphing nature of the incoming SSC-SCP engine, the specific Abstract Syntax accepted will depend upon the nature of the stored image, and the dgatesop.lst configuration file (of which a default version is automatically created when installing the Conquest DICOM server).

\*The server can accept many transfer syntaxes as configurable by *dgatesop.lst*.

#### **A.2.1.2.2.4 SOP Specific Conformance for Query/Retrieve FIND SOP Class SCP**

The C-FIND response status values are supported as defined in DICOM v3.0 Part 4.

All Required (R) and Unique (U) Study, Series, and Image Level Keys for the Patient Root, Study Root, and Patient/Study Only Query/Retrieve Information Model are supported. Many optional (O) Keys are supported, as described later in this document.

#### **A.2.1.2.2.5 SOP Specific Conformance for Query/Retrieve MOVE SOP Class SCP**

Prioritization of C-FIND & C-MOVE requests is all set to normal - 0.

All images requested in a single C-MOVE will be sent over a single association (the association will not be re-established for each image).

#### A.2.1.2.2.6 SOP Specific Conformance for “Unknown” Storage SCP

The specific Storage SCP classes accepted are programmable (by the user) at runtime, and cannot be explicitly stated here.

No optional elements are discarded.

The duration of the storage is temporary. Least recently added patients are deleted when the disk space is less than the amount specified in the “Cleanup disk space below (MB)” field in the Conquest DICOM server. This amount is run-time configurable. When the DICOM server is connected to a, e.g., jukebox archival system, the duration of storage can be made permanent.

#### A.2.1.2.2.7 Presentation Context Acceptance Criterion

No criterion.

#### A.2.1.3 Transfer Syntax Selection Policies

The server can accept most transfer syntaxes as configurable by *dgatesop.lst*. Outgoing connections can be made over uncompressed, loss-less or lossy JPEG(2000) transfer syntaxes. If so, the images are recompressed to conform to the accepted transfer syntax. The configuration is done through *acrnema.map*. Lossy compression configuration settings like j3 and j1 may be followed by a 2 digit quality percentage factor. Note that the effect of this quality factor differs between jpeg and jpeg2000.

Configuration	Proposed transfer syntaxes	Name
un <sup>1</sup> , as <sup>2</sup> , n1..n4 <sup>3</sup> , nj <sup>4</sup> , uj <sup>4</sup>	1.2.840.10008.1.2	ImplicitLittleEndian
ub	1.2.840.10008.1.2.1/2	ExplicitLittle/BigEndian
ul	1.2.840.10008.1.2.1	ExplicitLittleEndian

	1.2.840.10008.1.2.4.70	JPEG Lossless sv1
	1.2.840.10008.1.2	ImplicitLittleEndian
j3, j4 (or e.g., J380 for 80%quality)	1.2.840.10008.1.2.4.51	JPEG extended (12 bits)
	1.2.840.10008.1.2.4.50	JPEG baseline (8 bits)
	1.2.840.10008.1.2	ImplicitLittleEndian
j5	1.2.840.10008.1.2.4.53	JPEG spectral selection
	1.2.840.10008.1.2.4.51	JPEG extended (12 bits)
	1.2.840.10008.1.2.4.50	JPEG baseline (8 bits)
	1.2.840.10008.1.2	ImplicitLittleEndian
j6	1.2.840.10008.1.2.4.55	JPEG progressive
	1.2.840.10008.1.2.4.51	JPEG extended (12 bits)
	1.2.840.10008.1.2.4.50	JPEG baseline (8 bits)
	1.2.840.10008.1.2	ImplicitLittleEndian

jk <sup>5</sup>	1.2.840.10008.1.2.4.90	JPEG2000 Lossless
jl <sup>5</sup> (or e.g. jl80)	1.2.840.10008.1.2.4.91	JPEG2000 Lossy

**Note:** The transfer syntaxes are listed in order of priority. I.e., if a host is configured as jl and it accepts JPEG lossless, the image will be lossless JPEG compressed before transmission, even if it was not stored in that way.

- 1) un = uncompressed. Images will be decompressed prior to transmission.
- 2) The configuration “as” will transmit images as-is. Independent of how images are stored on disk (with JPEG or NKI compression), they will be transmitted over an ImplicitLittleEndian connection. This behavior does not conform to the DICOM standard and for many hosts this may therefore not work. NKI clients will work, though.
- 3) Configurations n1..n4 will transmit images with NKI private compression, which can only be read by NKI clients.
- 4) nj = nki compressed, leave jpeg as is; uj = uncompressed, leave jpeg as is
- 5) JPEG2000 compression is rather slow, a 512<sup>2</sup> is processed on an i7 machine in about 60 ms, versus <10 ms for JPEG and <3 ms for NKI compression.

### A.3. COMMUNICATION PROFILES

#### A.3.1 Supported Communication Stacks (parts 8,9)

DICOM Upper Layer (Part 8) is supported using TCP/IP.

#### A.3.2 OSI Stack

OSI stack not supported.

#### A.3.3 TCP/IP Stack

The TCP/IP stack is inherited from the Windows/Linux operating System. (Conquest addition): We have used the excellent Delphi TCP/IP components from François Piette (<http://www.overbyte.be>) in the CONQUEST user interface GUI.

##### A.3.3.1 API

Developers can base client programs on **TEST.EXE** and **DICOMP.EXE** that are included with source code in the **DICOMLIB1417b.ZIP** release file. The actual DICOM server (with many options) is **DGATE.EXE** that is included with source code in release file **DGATE1417b.ZIP** and **DICOMLIB1417b.ZIP**. Source code of the Windows user interface, client DLL (used for queries only) and web viewer OCX is *not* included. Developers can also add scripts in Lua or a limited private scripting language for several core server tasks to provide extensive processing of DICOM objects such as images and queries.

##### A.3.3.2 Physical Media Support

Any Windows (Linux) supported physical media.

#### A.3.4 Point-to-Point Stack

A 50 pin ACR-NEMA connection is not supported.

### A.4. EXTENSIONS / SPECIALIZATION / PRIVATIZATIONS

VR (0x7fdf, 0x0010) contains compressed pixel data if NKI compression is used. In the normal configuration, the server will never transmit NKI compressed data, but will compress and decompress the data on the fly. The following presentation contexts have been added to allow NKI private compressed data to be transmitted and to allow retrieval of downsized images for higher speed:

1.2.826.0.1.3680043.2.135.1066.5.1.4.1.2.1.2	PatientRootRetrieveNKI
1.2.826.0.1.3680043.2.135.1066.5.1.4.1.2.2.2	StudyRootRetrieveNKI
1.2.826.0.1.3680043.2.135.1066.5.1.4.1.2.3.2	PatientStudyOnlyRetrieveNKI

These contexts contain sub-classed versions of the standard C-MOVE commands with the following additional optional control parameters (numbers are hexadecimal):

(9999, 0100): MaxVrSize	Do not send VRs larger than this number of bytes
(9999, 0200): MaxRowsColumns	Downsize image to maximal this #rows and columns
(9999, 0201): Frame	If given, return only the selected frame of a MF object
(9999, 0300): ConsoleText	Text will be printed to server console
(9999, 0400): Silent	If sent, console does not log transaction
	Also used internally by GUI, WEB and scripting interface
(9999, 0500): MaxSlices	Send at most # slices irrespective of query result
(9999, 0600): MaxCompression	Maximum supported compression by NKI client (default 4)
(9999, 0700): Recompression	Recompress style NKI or JPEG (default none)
(9999, 0802): VirtualServerMask	Restrict access to selected virtual servers (default all used)
(9999, 0900): Script	'ImportConverter' with which transmitted objects are processed
(9999, 0a00): MoveOriginatorAE	The outgoing C-MOVE impersonates the passed AE

## A.5. WADO FUNCTIONALITY

## 4.2 PRODUCT INTERACTION / DESCRIPTION

- dgate.exe\*:** DICOM MicroPACS AE Main. This is the principal PACS application. It handles all connections (see threading model note in section 4.4 of this part). Contained in this executable are verification, storage, print, and various query and retrieve DICOM SOP classes. This executable interfaces to the PACS database via ODBC, MySQL or Postgres drivers, or using a built-in SQLite or dBaseIII driver. In the event that disk space is low, it will optionally delete least recently entered patients. This application also contains code for installation, maintenance, and archival operations that is used by the Conquest DICOM server. For these purposes a second copy of dgate.exe is started. Type “**dgate -?**” for more information. Then dgate.exe can send commands to a running Conquest PACS using dgate – commands. Then dgate.exe can interpret lua scripts in itself (dgate –dolua:) or trigger the server to do so (dgate –lua: and dgate –luastart:). Finally, the same executable may act as CGI/WADO server application. In some rare cases, the dgate process may still be running even though the user interface has closed (after a crash or after killing it with the task manager). The user interface, when restarted, then assumes that the dgate process belongs to a service (and displays “**user interface**” in the caption), but cannot control the running process. Killing the dgate process with the task manager or rebooting will solve this problem. All source code of dgate.exe is included in **DGATE1417d.ZIP** and **DICOMLIB1417d.ZIP**. To compile dgate.exe one can use total.cpp (documentation included). A github repository is being set up for more linux and unix orientated version dgate 1.4.18 (alpha version now)
- dgate64.exe** Identical application for use in a 64 bits windows OS. Dgate.exe or dgate64.exe are automatically selected. Delete dgate64.exe to force use of 32 bits in a 64 bit OS. At least one of dgate.exe or dgate64 must be present.
- dgate.dic\*:** DICOM dictionary used by dgate.exe. Must be present.
- dgateserv.exe:** Optional wrapper (V1.2) for dgate.exe to make it run as a Windows service. May be used (advanced users only) to manually (even remotely) start / stop / install / uninstall service(s). Type “**dgateserv /?**” for more information. Note that DICOM server services are named after the AE of the server. Once dgate.exe is installed as a service, the DICOM server(s) starts automatically when the computer is booted. When the user interface is started it will detect that the server is already running and connect to it. Source code is not included. Service install for Windows7 requires running the server in administrator mode.
- conquestdicomserver.exe:**  
This executable is the user interface and installation program and contains parts of the print server. See the installation

section of this document for its functions. The database browser tries to use the Borland Database Engine. Without BDE, the server will run fine, except one filter option in the browser. Source code is not included. This file is optional, the server can also run without a GUI.

cqdicom.dll: This is code for the Conquest DICOM client. It is used here to convert DICOM images for printing, list the image file header and provide query, move and echo actions from the GUI. The source code of this DLL is not included but it is based on the programs "TEST.EXE" and "DICOMP.EXE" that are included with source code. This file is not needed if the GUI is not used.

Libmysql.dll: When present, provides native access to MySQL, both for GUI and the server core. Redistributed because binary compatibility is required between compiled applications and the interface DLL: i.e. this file has to be of a specific version, even if it is used to communicate with MySQL databases of other versions. Comes from <http://downloads.mysql.com/archives/mysql-5.0/mysql-noinstall-5.0.22-win32.zip>

Libmysql64.dll: provides native access to MySQL for 64 bits server core

Libpq64.dll: provides (hard to find) native access to PostGres for 64 bits server core. Comes from: <http://forum.manifold.net/forum/t49971.21>. Note: the 32-bit PostGres client DLL's are not included in the distribution and must be taken from the bin folder of your PostGres distribution.

7za.exe: 7-zip command line version: used by the server core to unzip dropped zip files with dicom files, to zip log files, and to zip dicom data sets for submission over ssh-2.

pcsp.exe: used by the submit script and server commands to submit data over a ssh-2 connection.

jpeg2yuv.exe mpegtools utility to stream a series jpg images  
mpeg2enc mpegtools utility to encode a mpeg2 movie. For used by the WADO server when mpeg is requested (not implemented yet)

These files are generated by the GUI on install:

dicom.ini\* Configuration settings. File must be present but does not need to contain all settings.

acrnema.map\* List of known DICOM providers. The file must be present but may be empty if no C-MOVES are used.

dicom.sql\* Database table configuration. This file must be present if the database is used on if dicomquery is called from a lua script.

\*Minimal set of files for a server without a GUI.

Web server (place minimally these files marked with \* in your web server):

cgi-bin/Dgate.exe\*: exactly the same dgate.exe as in the server.

cgi-bin/Dicom.ini\*: specialized ini file for server running as web(cgi) client.

cgi-bin/acrnema.map\* List of known DICOM providers (may be in dicomserver folder).

cgi-bin/dicom.sql\* Database table configuration. (as above).

htdocs/ActiveFormProj1.ocx: Optional ActiveX web viewer, to be registered manually or downloaded from your web server and installed.

htdocs/conquest.jpg: Icon for use on the web pages

cgi-bin\samples\*.*	sample web scripts
cgi-bin\OpenClinica\*.*	scripts to drive an OpenClinica – PACS coupling
cgi-bin\viewers\*.*	scripts to drive different web viewers
cgi-bin\libs\*.*	lua extensions used by lua scripts run on the web server

### 4.3 THREADING ARCHITECTURE

The MicroPACS system was designed to run in two multithreading models. The first model is “Multithreaded”, the second is “Multiprocess”. The Multithreaded model can best be described as a monolithic application. Each incoming DICOM association is allocated a separate thread of execution within the same memory and address space of the master process. These threads share the same code within the single (monolithic) executable. The Multiprocess model is similar to "inet" on UNIX operating systems. There is a controlling application (conquestdicomserver.exe) which handles incoming TCP/IP connections. For each connection, a new copy of the MicroPACS main executable (dgate.exe) is loaded and executed. A separate process that runs in a separate address space from all other associations handles each DICOM association.

The multithreaded application is slightly faster than the multiprocess one; But the multiprocess one is more secure, and should be more reliable. Because each process runs in it's own address space, an association from one connection cannot corrupt or undermine (in any possible way) another simultaneous association. For this reason, the default installation of the MicroPACS was the multiprocess model.

However, extensive testing of the Conquest DICOM server showed that the multiprocess version sometimes failed to work correctly on Windows (some ODBC problem). For this reason, the multithreaded version is currently used with the Conquest DICOM server. Several fixes have increased its speed and made it very reliable.

Also, the built-in DBASEIII driver applies in-memory indexing and depends on the server process staying in memory to achieve a high speed. In the Linux version, the built-in DBASEIII driver, SQLite, PostGres and MySQL are the database drivers available.

 19990110: Added n, for MAGn, as parameter in -as and -ab archiving options (default all). Use exit(1) on failure

20010328: Added -av: verify mirror disk

20010415: Added DeleteSeries, DeleteStudy and DeleteImage routines and  
-f options

20010416: Added -f options: -feFile = enter MAGN file into DB, -fdFile =  
delete file from DB -faFile = add (also makes copy) file into  
server, -f?=ask UID of file, -fu = generate UID,  
-fcNEWPATID,file = modify patient ID of image file (moves  
file!). NOTE: -fc is irreversible in the sense that if a portion of a  
study/series is changed and changed back it winds up as a  
different study/series. This occurs because the UIDs must be  
changed for each image modification. This problem does not  
occur when a whole series or study is changed

20010417: Simplified code to change uids to allow easy extension to  
referenced SOPs. Check after load on common UIDs to avoid  
accepting dropped non-dicom files. NOTE: ChangeUIDinDDO  
should also change sequences and referenced SOPs  
(0008,1155)

20010418: Fix in above change

20010418: Changed names of database fields in UIDMODS - did not work  
on MsAccess

20010419: Added -fk option: copy image file to other patient ID (as -fc but  
no delete). Added version number 1.3.9 to command line help

20010429: Added -fz option: zap file from server and database

20010430: Some work on read ahead thread: note that thread must not use  
any pointer copy!

20010502: Made read ahead thread working; fixed thread counter; fix odbc  
option: strings too short

20020506: Fixed handle leak in read ahead thread

20020507: Fixed memory leak in read ahead thread; kbhit() test #ifdef  
DO\_LEAK\_DETECTION

20010509: Added RenameDevice is -ae option

20010730: Replaced parameter argv[0] of ExportConverters to proper  
value.

20010829: Added ExportStationName as export filter; default Export...  
value set to "\*"; Made export comparisons case insensitive;  
added special 'forward to AE' ExportConverter; Version to  
1.3.10

20010831: Added extended syntax for exportconverters with %f=filename,  
%m=modality, %s=stationname, %b=file base name, %p=file  
path; Also allows 'copy %f destination', but for windows NT  
only (uses cmd.exe). Added ExportFilter option that uses an  
SQL statement to filter.

20010901: Added a simple queue to process exportconverters  
asynchronously; Create a queue for each converter; queue  
mirror copy requests

20010902: Added %o = SOP; %n = newline; added the following hard coded converters: append "text" to file; write "text" to file; copy file to file; copy file to dir

20010904: Re-entered change of 20010730

20010905: Fix: After 'SaveToDisk', do not free pDDO

20011109: Fix: made ExportConverter stuff case insensitive  
Note: empty filter tests for empty contents - this is not the same as '\*'

20011110: Note: in release 1.3.10, the " to " in e.g., write "%f%n" to file must be lowercase

20011115: Made " to" case insensitive; Added \*\*\* before some error messages for better logging. Removed cache db: would hang the server if SQL has gone down and up. Now use one DB per thread which is passed to the read ahead thread = fast too!

20011207: Added extra errormessage when creation of datasource fails

20020109: Disabled this code for watcom or borland (instead of run-time loading an address)

20020314: Implemented ignore of C-CANCEL request for ADAC NM (was error before). Blocked out SQLInstallerError call; does not compile on clinical MS4.2

20020413: Added some notes about thread safety and db's: The serverchild is not thread safe when reading and writing is done on the same association.

20020415: Added -atDEVICE option: sanity check of images on disk; version to 1.3.11

20020416: Made UID generator configurable through UIDPrefix in dicom.ini; made time print unsigned

20020422: Sleazy fix of ModifyPatID: time(null) created same UID: now wait 1 s per changed file

20020426: Generate filename no longer gives an error: is done at higher level

20020428: Only serious error messages use \*\*\* in message

20020428: Added FAILSAFE\_STORAGE: tries to save incoming files even when DB errors occur

20020429: Put SaveToDisk in myUnknownStorage: pass DB failures to caller; Disabled FAILSAFE\_STORAGE: any storage failures should now be detected by client

20020508: Do not rewrite image not on MAG but it is not an error (warning is generated earlier)

20020520: Added -gSERVER,DATE option: grab images on date from remote server

20020521: fix displaying junk filename when rewriting image not on MAG

20020522: Fix in SetStringVR: strings must be padded with a space

20020529: -i and -r now have mode parameter (0=normal and default, 1=simple, e.g., for DBASEIII)

20020531: In 'QualifyOn', support case-sensitive call to 'GetACRNema', but make AE-Title uppercase after retrieving IP and port.

20020613: Better handling of Compression ON/OFF in 'SaveToDisk'  
Fixed crash in DeleteImageFile (twice free of VR->Data)

20021016: Added (indexed) patid to exportfilter query and getfilename for speed; The option tests for rev5 db or higher; increase 64 strings to 66; Note: GrabImagesFromServer option does not yet pass patid to the query (i.e., will be slow with non-odbc driver)

20021017: Control NeedPack from here; added -c option: set UID counter at startup. Removed Sleep from anonymize options; do not re-create UIDMODS

20021018: Pass NoKill through GenerateFilename for interactive DGATE

20021115: Use Generic style retrieve classes with NKIqrsop code instead of older qrsop code. Advantages: read ahead thread used, and allows print of error messages from C-MOVE. Required changes such that ratd->pcdo can be NULL.

20021121: Disabled read-ahead thread for time being

20021212: Also loop ServerApp.Server(Port) in threaded mode server

20021213: Re-entered fix by Hanne Kooy: compressed forwarding had extra ;

20030701: QualifyOn now also has compression parameter

20030703: Moved compression code to nkiqrsop; dgate -j-xx and -j\*xx = test compression options. Removed "forward compressed to" because "forward compressed as .. to" is better. Note that FileCompressMode is now obsolete. KNOWN BUG: JPEG compressed images may be rewritten as V2 (when written originally as NKI) which are then not correctly read.

20030704: Made that FileCompressMode parameter still works even though is obsolete. Moved faulty delete DDO after SOPUnknownStorage.Read

20030705: Added check of Transfer Syntax next to extension for save type; ProcessDDO takes \*\*DDO

20050107: Added code to hold and retry queued forwards and mirror copies when failed: After failed export/copy, start storing entries in file ExportFailuresN (CopyFailures). If a new export/copy is requested >1 minute after last failed one, try again; if queue is empty, >100 seconds after last fail, try export/copy stored ones. Processing queued entries has priority over processing stored entries.

Note: get/put\_param work through disk (read\_ini activates), get/put\_amap through memory (write\_amap writes to disk), get/put\_sop etc read from memory and write to mem and disk.

- 20070316: Display defer import converter; Clumsily added <compression> import converter and improved <storage> import converter; Made <storage> thread safe. Failed recompress() no longer reason to fail drag and drop; add convert\_to\_bmp. Use | instead of , to separate patientid from file in addimagefile:  
Distributed , code to each of the server commands to make it more , safe. Note: it is NOT a good idea to use a , in a flexible filenamesyntax. Added level & window to convert\_to\_gif and convert\_to\_bmp; longer log lines for dump VR
- 20070317: <prefetch> using new prefetch\_queue, mayprocess and into\_queue\_unique, <preforward>, <preget>

 to DataSource

This option should read 4D CT (not tested) as well as 4D MRI/DTI (tested) as long as all frames are sent as one series.

In this way, both Philips and GE DTI and perfusion data (without fringes, e.g., MMMMMM) and Siemens RCCT data is supported. Note 1: Siemens writes % of cycle in 0018,0022 as 'TP100PC5576', where 100 is the %. Not used for now, 4D data is just ordered based on slice number instead, with coordinates 0, 1, .. Note 2: some localizer series are now returned as 4D as well.
